Principals of EMI have been working closely with the Hart County Water and Sewer Authority since 1999. Following a County Wide Water System Master Plan prepared by EMI, the Authority has successfully completed major portions of the system during the past 17 years. Over 130 miles of new water mains have been installed to ensure the residents of Hart County have an acceptable quantity and quality of water needed for domestic use and fire protection. Many of the priority areas have been served and the water system has eliminated problems with dry/contaminated wells, taste and/or odor problems, and lack of much needed fire protection.

In addition to providing planning and funding procurement, EMI has provided complete surveying, engineering and environmental services including State and Federal permitting. EMI also maintains a current hydraulic water model of the system, complete GIS mapping, as well as water and sewer standards and SOP manuals.
